Non-perfect rings and a theorem of Eklof and Shelah

Comment.Math.Univ.Carolinae 32,1 (1991) 27-32.

Abstract: We prove a stronger form, A^+, of a consistency result, A, due to Eklof and Shelah. A^+ concerns extension properties of modules over non-left perfect rings. We also show (in ZFC) that A does not hold for left perfect rings.

Keywords: perfect ring, Ext, uniformization
