On the structure of finite loop capable Abelian groups

Comment.Math.Univ.Carolin. 48,2 (2007) 217-224.

Abstract: Loop capable groups are groups which are isomorphic to inner mapping groups of loops. In this paper we show that abelian groups $C_p^k \times C_p \times C_p$, where $k \geq 2$ and p is an odd prime, are not loop capable groups. We also discuss generalizations of this result.

Keywords: loop, group, connected transversals
