## On complemented copies of $c_0$ in spaces of operators, II

GIOVANNI EMMANUELE\*

Abstract. We show that as soon as  $c_0$  embeds complementably into the space of all weakly compact operators from X to Y, then it must live either in  $X^*$  or in Y.

Keywords: spaces of weakly compact operators, complemented copies of  $c_0$ Classification: 46B25, 46A32

Let X and Y be two infinite dimensional Banach spaces. It is well known (see for instance [E1], [E3], [E4], [EJ], [F], [H], [K]) that  $c_0$  can embed into K(X, Y), the space of all compact operators from X to Y equipped with the operator norm, even if it does not embed into  $X^*$  and Y; furthermore, such a copy of  $c_0$  can be complemented in K(X, Y) (see [E4], [E6]).

Recently ([E2], [E5]), we obtained some results proving that if  $c_0$  embeds into either  $X^*$  or Y then it embeds complementably into some spaces of operators larger than K(X,Y), for instance W(X,Y), the space of all weakly compact operators from X to Y. The technique we used in order to construct the complemented copy of  $c_0$  requires the presence of a copy of  $c_0$  in either  $X^*$  or Y, because otherwise it does not work.

All the above facts lead us to the following natural question: Is it possible to have a complemented copy of  $c_0$  inside W(X,Y) even when it does not embed into  $X^*$  and Y?

In this short note (in which we continue the research started in [E5]) we want to show that the answer to this question is negative; indeed, we prove that as soon as  $c_0$  embeds complementably into W(X, Y), then it must live inside either  $X^*$  or Y. Actually, we shall prove a slightly more general result about the space  $L_{w^*}(X^*, Y)$ , i.e. the space of all weak\*-weak continuous operators from  $X^*$  to Y equipped with the operator norm.

The announced result is the following

**Theorem 1.** Let H be a complemented copy of  $c_0$  in  $L_{w^*}(X^*, Y)$ . If  $T_n$  is a basis for H, then there is either a  $x_0^* \in B_{X^*}$  or a  $y_0^* \in B_{Y^*}$  and a subsequence  $(T_{n_k})$  of  $(T_n)$  such that either the sequence  $(T_{n_k}(x_0^*))$  spans a copy of  $c_0$  in Y or the sequence  $(T_{n_k}^*(y_0^*))$  spans a copy of  $c_0$  in X.

PROOF: It is clear that for each  $x^* \in B_{X^*}$  (resp.  $y^* \in B_{Y^*}$ ) the series  $\sum T_{n_k}(x^*)$  (resp.  $\sum T_{n_k}^*(y^*)$ ) is weakly unconditionally converging in Y (resp. in X). It will

be enough to show that there is either a  $x_0^* \in B_{X^*}$  or a  $y_0^* \in B_{Y^*}$  and a subsequence  $(T_{n_h})$  of  $(T_n)$  such that either the series  $\sum T_{n_h}(x_0^*)$  is not unconditionally converging in Y or the series  $\sum T_{n_h}^*(y_0^*)$  is not unconditionally converging in X, because we can thus use a well known result due to Bessaga and Pelczynski ([BP]) to conclude our proof. By contradiction we assume that for each  $x^* \in B_{X^*}$  and  $y^* \in B_{Y^*}$  the series  $\sum T_n(x^*)$  and  $\sum T_n^*(y^*)$  are unconditionally converging in Y and X, respectively. So for any  $\xi = (\xi_n) \in l_\infty$  and  $x^* \in B_{X^*}$  the series  $\sum \xi_n T_n(x^*)$  is unconditionally converging in Y. Define  $T_{\xi}(x^*) = \sum \xi_n T_n(x^*)$  for all  $x^* \in B_{X^*}$ . We now show that  $T_{\xi}$  belongs to  $L_{w^*}(X^*, Y)$ . To this aim it will be enough to consider a w<sup>\*</sup>-null net  $(x_{\alpha}^*)$  in  $B_{X^*}$  and a  $y^*$  in  $B_{Y^*}$  and to prove that

(1) 
$$\lim_{\alpha} |T_{\xi}(x_{\alpha}^*)(y^*)| = 0.$$

Since  $\sum \xi_n T_n^*(y^*)$  is unconditionally converging in X by our assumption, we have

(2) 
$$\lim_{p} \sup_{x^* \in B_{X^*}} |\sum_{n=p+1}^{\infty} \xi_n T_n^*(y^*)(x^*)| = 0.$$

Thanks to (2), given  $\gamma > 0$  we can find a  $\overline{p} \in N$  such that

(3) 
$$\sup_{\alpha} |\sum_{n=\overline{p}+1}^{\infty} \xi_n T_n^*(y^*)(x_{\alpha}^*)| < \frac{\gamma}{2}.$$

On the other hand,

(4) 
$$\lim_{\alpha} \sum_{n=1}^{\overline{p}} \xi_n T_n(x_{\alpha}^*)(y^*) = 0$$

since  $T_n \in L_{w^*}(X^*, Y)$ , for all  $n \in N$ . (3) and (4) together give (1).

Furthermore, using the Closed Graph Theorem we can prove easily that the linear map  $\Psi : l_{\infty} \to L_{w^*}(X^*, Y)$  defined by  $\Psi(\xi) = T_{\xi}$  is bounded. It is clear that  $K = \Psi(l_{\infty})$  contains H. If  $P : L_{w^*}(X^*, Y) \longrightarrow H$  is the existing projection, the operator  $P_{|K}\Psi : l_{\infty} \longrightarrow H$  is a quotient map of  $l_{\infty}$  onto  $c_0$ . This is a well known contradiction ([D]) that concludes our proof.

**Corollary 2.** Let  $c_0$  embed complementably into W(X, Y). Then  $c_0$  embeds into either  $X^*$  or Y.

**PROOF:** It is enough to observe that W(X, Y) is isomorphic with  $L_{w^*}(X^{**}, Y)$ .

With a proof similar to that of Theorem 1 we can prove the same result for the space L(X, Y) of all bounded operators from X to Y. One could also consider the space UC(X, Y) of all unconditionally converging operators from X to Y; in such

a case we have been able to get just a slightly less precise result than Theorem 1; indeed, the same technique used for proving Theorem 1 shows that as soon as  $c_0$  embeds complementably in UC(X, Y), then either Y contains a copy of  $c_0$ or there are a  $y_0^* \in B_{Y^*}$  and a subsequence  $(T_{n_k})$  of  $(T_n)$  so that the sequence  $(T_{n_k}^*(y_0^*))$  spans a copy of  $c_0$  in  $X^*$ , but in such a case we do not know how the copy of  $c_0$  contained in Y is spanned.

At the end, we observe that in the paper [E5] we also considered other spaces of operators, such as spaces of Dunford-Pettis operators; we do not know if Theorem 1 can be extended to cover this case.
