

## On Mikheev’s construction of enveloping groups

J.I. HALL

*Abstract.* Mikheev, starting from a Moufang loop, constructed a groupoid and reported that this groupoid is in fact a group which, in an appropriate sense, is universal with respect to enveloping the Moufang loop. Later Grishkov and Zavarnitsine gave a complete proof of Mikheev’s results. Here we give a direct and self-contained proof that Mikheev’s groupoid is a group, in the process extending the result from Moufang loops to Bol loops.

*Keywords:* Bol loop, Moufang loop, autotopism group, group with triality

*Classification:* 20N05

### 1. Introduction

A *groupoid*  $(Q, \circ)$  is a set  $Q$  endowed with a binary product  $\circ : Q \times Q \longrightarrow Q$ . The groupoid is a *quasigroup* if, for each  $x \in Q$ , the right translation map  $R_x : Q \longrightarrow Q$  and left translation map  $L_x : Q \longrightarrow Q$  given by

$$aR_x = a \circ x \quad \text{and} \quad aL_x = x \circ a$$

are both permutations of  $Q$ .

The groupoid  $(Q, \circ)$  is a *groupoid with identity* if it has a two-sided identity element:

$$1 \circ x = x = x \circ 1, \quad \text{for all } x \in Q.$$

That is,  $R_1$  and  $L_1$  are  $\text{Id}_Q$ , the identity permutation of  $Q$ . A quasigroup with identity is a *loop*.

The loop  $(Q, \circ)$  is a (*right*) *Bol* loop if it identically has the right Bol property:

$$\text{for all } a, b, x \in Q, \quad a((xb)x) = ((ax)b)x.$$

(We often abuse notation by writing  $pq$  in place of  $p \circ q$ .) The loop is a *Moufang* loop if it has the Moufang property:

$$\text{for all } a, b, x \in Q, \quad a(x(bx)) = ((ax)b)x.$$

Finally the loop is a *group* if it has the associative property:

$$\text{for all } a, b, x \in Q, \quad a(xb) = (ax)b.$$

---

Partial support provided by the National Science Foundation, USA.

The Moufang property is clearly a weakened form of the associative property. Furthermore, with  $a = 1$  the Moufang property gives  $x(bx) = (xb)x$  identically; so the Bol property is a consequence of the Moufang property. Thus every group is a Moufang loop and every Moufang loop is a Bol loop. The reverse implications do not hold in general; see [6, Examples IV.1.1 and IV.6.2].

A (right) pseudo-automorphism of the groupoid with identity  $(Q, \circ)$  is a permutation  $A$  of  $Q$  equipped with an element  $a \in Q$ , a companion of  $A$ , for which  $R_a$  is a permutation (always true for  $(Q, \circ)$  a loop) and such that

$$xA \circ (yA \circ a) = (xy)A \circ a$$

for all  $x, y \in Q$ . We shall abuse this terminology by referring to the pair  $(A, a)$  as a pseudo-automorphism. The set of all pseudo-automorphisms  $(A, a)$  is then denoted  $\text{PsAut}(Q, \circ)$  and admits the group operation

$$(A, a)(D, d) = (AD, aD \circ d),$$

as we shall verify in Proposition 2.1 below.

In the research report [5] Mikheev, starting from a Moufang loop  $(Q, \circ)$ , constructed a groupoid on the set  $\text{PsAut}(Q, \circ) \times Q$ . The main results reported by Mikheev are that this groupoid is in fact a group and that, in an appropriate sense, it is universal with respect to “enveloping” the Moufang loop  $(Q, \circ)$ .

In [3] Grishkov and Zavarnitsine gave a complete proof of Mikheev’s results (and a great deal more). Concerning Mikheev’s construction they proved:

**Theorem 1.1.** *Let  $(Q, \circ)$  be a Moufang loop.*

(a) *The groupoid  $(\text{PsAut}(Q, \circ) \times Q, \star)$  given by*

$$\begin{aligned} \{(A, a), x\} \star \{(B, b), y\} &= \{(A, a)(B, b)(C, c), (xB)y\} \quad \text{with} \\ \text{(Mk)} \quad (C, c) &= \left( R_{xB, b}^{-1}, (((xB)b)^{-1}b)xB \right) \left( R_{xB, y}, ((xB)^{-1}y^{-1})((xB)y) \right) \end{aligned}$$

*is a group  $\mathcal{W}(Q, \circ)$ .*

(b) *The group  $\mathcal{W}(Q, \circ)$  admits a group of triality automorphisms and is universal (in an appropriate sense) among all the groups admitting triality that envelope the Moufang loop  $(Q, \circ)$ .*

Here for each  $p, q$  in an arbitrary loop  $(Q, \circ)$  we have set  $R_{p,q} = R_p R_q R_{pq}^{-1}$ .

The expression (Mk) can be simplified somewhat. By Moufang’s Theorem ([1, p. 117] and [6, Cor. IV.2.9]) Moufang loops generated by two elements are groups, so within  $(Q, \circ)$  commutators

$$[p, q] = p^{-1}q^{-1}pq = (qp)^{-1}pq$$

are well-defined, as seen in Mikheev’s original formulation [5]. Also in Moufang loops we have  $R_{p,q}^{-1} = R_{q,p}$  by [1, Lemma VII.5.4]. Therefore Grishkov and Zavarnitsine could give (Mk) in the pleasing form

$$(C, c) = (R_{b,xB}, [b, xB]) (R_{xB,y}, [xB, y]).$$

Grishkov and Zavarnitsine [3, Corollary 1] verify Mikheev’s construction by first constructing from  $(Q, \circ)$  a particular group admitting triality and then showing that Mikheev’s groupoid is a quotient of that group and especially is itself a group. Their construction displays universal properties for the two groups admitting triality and so also for Mikheev’s enveloping group. (Grishkov and Zavarnitsine also correct several small misprints from [5].)

In this short note we take a different approach. In particular we give a direct and self-contained proof that Mikheev’s groupoid is a group. In the process we extend the result from Moufang loops to Bol loops, and we see that the groupoid has a natural life as a group.

An *autotopism*  $(A, B, C)$  of the groupoid  $(Q, \circ)$  is a triple of permutations of  $Q$  such that

$$xA \circ yB = (x \circ y)C$$

for all  $x, y \in Q$ . Clearly the set  $\text{Atop}(Q, \circ)$  of all autotopisms of  $(Q, \circ)$  forms a group under composition.

We then have

**Theorem 1.2.** *Let  $(Q, \circ)$  be a Bol loop. The groupoid  $(\text{PsAut}(Q, \circ) \times Q, \star)$  with product given by (Mk) is isomorphic to the autotopism group  $\text{Atop}(Q, \circ)$ . In particular  $(\text{PsAut}(Q, \circ) \times Q, \star)$  is a group.*

Theorem 1.2 gives Theorem 1.1(a) immediately, and 1.1(b) directly follows. Indeed following Doro [2], the group  $G$  admits triality if  $G$  admits the symmetric group of degree three,  $\text{Sym}(3) = S$ , as a group of automorphism such that, for  $\sigma$  of order 2 and  $\tau$  of order 3 in  $S$ , the identity  $[g, \sigma][g, \sigma]^\tau [g, \sigma]^{\tau^2} = 1$  holds for all  $g \in G$ . Doro proved that the set  $\{ [g, \sigma] \mid g \in G \}$  naturally carries the structure of a Moufang loop  $(Q, \circ)$ ; we say that  $G$  envelopes  $(Q, \circ)$ . Many nonisomorphic groups admitting triality envelope Moufang loops isomorphic to  $(Q, \circ)$ . Among these the autotopism group  $A = \text{Atop}(Q, \circ)$  is the largest that is additionally faithful, which is to say that the centralizer of  $S^A$  within  $A \times S$  is the identity. That is, for every group  $G$  admitting triality that is faithful and envelopes  $(Q, \circ)$  there is an  $S$ -injection of  $G$  into  $A$ . This is the universal property examined by Mikheev, Grishkov, and Zavarnitsine. See [4, §10.3] for further details.

The general references for this note are the excellent books [1] and [6]. Several of the results given here are related to ones from [6] — both as exact versions (“see”) and as variants or extensions (“compare”).

**2. Autotopisms of groupoids**

**Proposition 2.1.** *Let  $(Q, \circ)$  be a groupoid with identity 1. The map*

$$\psi: (A, a) \mapsto (A, AR_a, AR_a)$$

*gives a bijection of  $\text{PsAut}(Q, \circ)$  with the subgroup of  $\text{Atop}(Q, \circ)$  consisting of all autotopisms  $(A, B, C)$  for which  $1A = 1$ . For such an autotopism we have*

$$\psi^{-1}(A, B, C) = (A, 1C).$$

*In particular  $\text{PsAut}(Q, \circ)$  is a group under the composition*

$$(A, a)(D, d) = (AD, aD \circ d).$$

PROOF: (Compare [6, III.4.14].) If  $(A, a)$  is a pseudo-automorphism then  $(A, AR_a, AR_a)$  is an autotopism by definition. In particular for every  $x \in Q$  we have  $1A \circ xAR_a = (1 \circ x)AR_a = xAR_a$ . As  $AR_a$  is a permutation of  $Q$ , there is an  $x$  with  $1 = xAR_a$ . Thus  $1A = 1A \circ 1 = 1$ .

If  $(A, a)$  and  $(B, b)$  are pseudo-automorphisms with  $(A, AR_a, AR_a)$  equal to  $(B, BR_b, BR_b)$ , then  $A = B$  and  $a = 1AR_a = 1BR_b = b$ ; so  $\psi$  is an injection of  $\text{PsAut}(Q, \circ)$  into the described subgroup of  $\text{Atop}(Q, \circ)$ .

Now suppose that  $(A, B, C)$  is an autotopism with  $1A = 1$ . Always  $1 \circ x = x$ , so

$$xB = 1A \circ xB = (1 \circ x)C = xC,$$

giving  $B = C$ .

Again  $x \circ 1 = x$  and

$$xA \circ 1C = (x \circ 1)C = xC.$$

That is  $B = C = AR_{1C}$ , and in particular  $R_{1C}$  is a permutation. Therefore  $(A, B, C) = (A, AR_a, AR_a)$ , the image of the pseudo-automorphism  $(A, a)$  for  $a = 1C$ . The map  $\psi$  is indeed a bijection.

Those autotopisms with  $1A=1$  clearly form a subgroup, so  $\psi^{-1}$  gives  $\text{PsAut}(Q, \circ)$  a natural group structure. We find

$$\begin{aligned} \psi(A, a)\psi(D, d) &= (A, AR_a, AR_a)(D, DR_d, DR_d) \\ &= (AD, AR_aDR_d, AR_aDR_d) \\ &= \psi(AD, e) \end{aligned}$$

for some  $e$  with  $AR_aDR_d = ADR_e$ . Indeed  $e = 1ADR_e = 1AR_aDR_d = aD \circ d$ . Therefore multiplication in  $\text{PsAut}(Q, \circ)$  is given by

$$(A, a)(D, d) = (AD, aD \circ d),$$

as stated here and above. □

From now on we identify  $\text{PsAut}(Q, \circ)$  with its isomorphic image under  $\psi$  in  $\text{Atop}(Q, \circ)$ .

- Corollary 2.2.** (a) *Let  $(A, B, C)$  and  $(D, E, F)$  be autotopisms of the groupoid with identity  $(Q, \circ)$ . Then we have  $(A, B, C) = (D, E, F)$  if and only if  $A = D$  and  $1C = 1F$ .*  
 (b) *Let  $(A, B, C)$  and  $(D, E, F)$  be autotopisms of the loop  $(Q, \circ)$ . Then we have  $(A, B, C) = (D, E, F)$  if and only if  $A = D$  and there is an  $x \in Q$  with  $xC = xF$ .*

PROOF: (Compare [6, III.3.1].) One direction is clear.

Now suppose that  $A = D$ .

$$\begin{aligned} (X, Y, Z) &= (A, B, C)(D, E, F)^{-1} \\ &= (AD^{-1}, BE^{-1}, CF^{-1}) \\ &= (\text{Id}_Q, BE^{-1}, CF^{-1}) \\ &= (\text{Id}_Q, \text{Id}_Q R_e, \text{Id}_Q R_e) \\ &= (\text{Id}_Q, R_e, R_e) \end{aligned}$$

for  $e = 1CF^{-1}$  by the proposition.

For any  $x$  with  $xC = xF$  we then have

$$x \circ 1 = x = xCF^{-1} = xZ = x \circ e,$$

so in both parts of the corollary we find  $e = 1$ . Therefore  $(X, Y, Z)$  is equal to  $(\text{Id}_Q, \text{Id}_Q, \text{Id}_Q)$ , the identity of  $\text{Atop}(Q, \circ)$ . □

A particular consequence of the corollary is that we may (if we wish) denote the autotopism  $(A, B, C)$  by  $(A, *, C)$ , since  $A$  and  $C$  determine  $B$  uniquely.

### 3. Autotopisms of Bol loops

Recall that a Bol loop  $(Q, \circ)$  is a loop with

$$\text{for all } a, b, x \in Q, \quad a((xb)x) = ((ax)b)x.$$

- Lemma 3.1.** (a) *The loop  $(Q, \circ)$  is a Bol loop if and only if  $(R_x^{-1}, L_x R_x, R_x)$  is an autotopism for all  $x \in Q$ .*  
 (b) *The Bol loop  $(Q, \circ)$  is a right inverse property loop. That is, for  $x^{-1}$  defined by  $xx^{-1} = 1$  we have  $(x^{-1})^{-1} = x$  and  $(ax)x^{-1} = a$ , for all  $a, x \in Q$ . In particular  $R_x^{-1} = R_{x^{-1}}$  for all  $x$ .*

PROOF: (a) (See [6, Theorem IV.6.7].) For a fixed  $x \in Q$  we have  $a((xb)x) = ((ax)b)x$  for all  $a, b \in Q$  if and only if  $(cR_x^{-1})(bL_x R_x) = (cb)R_x$  for all  $c (= ax)$ ,  $b \in Q$  if and only if  $(R_x^{-1}, L_x R_x, R_x)$  is an autotopism.

(b) (See [6, Theorem IV.6.3].) In the identity  $a((xb)x) = ((ax)b)x$  set  $b = x^{-1}$  to find  $ax = a((xx^{-1})x) = ((ax)x^{-1})x$ . That is,  $aR_x = (ax)x^{-1}R_x$  and so

$a = (ax)x^{-1}$ . Further set  $a = x^{-1}$  in this identity, giving

$$1R_{x^{-1}} = x^{-1} = (x^{-1}x)x^{-1} = (x^{-1}x)R_{x^{-1}},$$

whence  $1 = x^{-1}x$  and  $(x^{-1})^{-1} = x$ . □

Throughout the balance of this section let  $(Q, \circ)$  be a Bol loop.

For all  $p$  in the Bol loop  $(Q, \circ)$  set

$$r_p = (R_{p^{-1}}^{-1}, L_{p^{-1}}R_{p^{-1}}, R_{p^{-1}}) = (R_p, L_{p^{-1}}R_{p^{-1}}, R_{p^{-1}}),$$

and set  $r_{p,q} = r_p r_q r_{pq}^{-1}$  for all  $p, q$ . By the lemma, each  $r_p$  and  $r_{p,q}$  is an autotopism of  $(Q, \circ)$ .

**Lemma 3.2.** (a)  $r_p^{-1} = r_{p^{-1}}$ .

(b)  $r_{p,q} = (R_{p,q}, (p^{-1}q^{-1})(pq))$ .

(c)  $r_{p,q}^{-1} = (R_{p,q}^{-1}, ((pq)^{-1}q)p)$ .

PROOF: By Lemma 3.1

$$r_p^{-1} = (R_p^{-1}, *, R_{p^{-1}}) = (R_p^{-1}, *, R_p) = (R_{p^{-1}}, *, R_p) = r_{p^{-1}},$$

as in (a). Therefore

$$r_{p,q} = r_p r_q r_{pq}^{-1} = (R_p R_q R_{pq}^{-1}, *, R_{p^{-1}} R_{q^{-1}} R_{pq}) = (R_{p,q}, *, R_{p^{-1}} R_{q^{-1}} R_{pq})$$

and

$$r_{p,q}^{-1} = (R_{p,q}, *, R_{p^{-1}} R_{q^{-1}} R_{pq})^{-1} = (R_{p,q}^{-1}, *, R_{(pq)^{-1}} R_q R_p).$$

Here

$$1 R_p R_q R_{pq}^{-1} = (pq)(pq)^{-1} = 1;$$

$$1 R_{p^{-1}} R_{q^{-1}} R_{pq} = (p^{-1}q^{-1})(pq);$$

$$1 R_{(pq)^{-1}} R_q R_p = ((pq)^{-1}q)p.$$

The first calculation tells us that  $r_{p,q}$  (and  $r_{p,q}^{-1}$ ) are in  $\text{PsAut}(Q, \circ)$ . The second, together with Proposition 2.1, then gives (b) and the third (c). □

**Proposition 3.3.** *Let  $(X, Y, Z)$  be in  $\text{Atop}(Q, \circ)$ . Set  $x = 1X$ ,  $A = XR_x^{-1}$ , and  $a = 1Z \circ x$ . Then*

$$(X, Y, Z) = (A, a)r_x.$$

*In particular  $\{r_x \mid x \in Q\}$  is a set of right coset representatives for the subgroup  $\text{PsAut}(Q, \circ)$  in  $\text{Atop}(Q, \circ)$ .*

PROOF: (Compare [6, III.4.16, IV.6.8].)

$$\begin{aligned} (X, Y, Z) &= (X, Y, Z)r_x^{-1}r_x \\ &= (XR_x^{-1}, YR_{x^{-1}}^{-1}L_{x^{-1}}^{-1}, ZR_{x^{-1}}^{-1})r_x \\ &= (XR_{x^{-1}}, *, ZR_x)r_x. \end{aligned}$$

For  $A = XR_x^{-1} = XR_{x^{-1}}$  we have  $1A = 1XR_{x^{-1}} = x \circ x^{-1} = 1$ . Furthermore  $1ZR_x = 1Z \circ x = a$ , so by Proposition 2.1 we have  $(X, Y, Z) = (A, a)r_x$ .  $\square$

**Proposition 3.4.**  $r_x(B, b) = (B, b)r_{(xB)b}r_b^{-1}$

PROOF: We have

$$\begin{aligned} r_x(B, b) &= (R_x, L_{x^{-1}}R_{x^{-1}}, R_{x^{-1}})(B, BR_b, BR_b) \\ &= (R_x B, *, R_{x^{-1}}BR_b) \end{aligned}$$

and

$$\begin{aligned} (B, b)r_{(xB)b}r_b^{-1} &= (B, BR_b, BR_b)(R_{(xB)b}, *, R_{((xB)b)^{-1}})(R_b^{-1}, *, R_b) \\ &= (BR_{(xB)b}R_b^{-1}, *, BR_bR_{((xB)b)^{-1}}R_b). \end{aligned}$$

First we observe that  $xR_{x^{-1}}BR_b = 1BR_b = b$  and

$$xBR_bR_{((xB)b)^{-1}}R_b = ((xB)b)R_{((xB)b)^{-1}}R_b = 1R_b = b.$$

Therefore by Corollary 2.2 we need only verify  $R_x B = BR_{(xB)b}R_b^{-1}$  to prove the proposition.

As  $(B, b)$  is a pseudo-automorphism

$$\begin{aligned} pR_x BR_b &= (px)BR_b \\ &= (px)B \circ b \\ &= pB \circ (xB \circ b) \\ &= pBR_{(xB)b} \end{aligned}$$

for every  $p \in Q$ . Therefore  $R_x BR_b = BR_{(xB)b}$  and  $R_x B = BR_{(xB)b}R_b^{-1}$  as desired.  $\square$

**Corollary 3.5.**  $(A, a)r_x(B, b)r_y = (A, a)(B, b)r_{xB, b}^{-1}r_{xB, y}r_{(xB)y}$ .

PROOF:

$$\begin{aligned}
 (A, a)r_x(B, b)r_y &= (A, a)(r_x(B, b))r_y \\
 &= (A, a)((B, b)r_{(xB)b}r_b^{-1})r_y \\
 &= (A, a)(B, b)r_{(xB)b}r_b^{-1}(r_{xB}^{-1}r_{xB})r_y(r_{(xB)y}^{-1}r_{(xB)y}) \\
 &= (A, a)(B, b)(r_{(xB)b}r_b^{-1}r_{xB}^{-1})(r_{xB}r_yr_{(xB)y}^{-1})r_{(xB)y} \\
 &= (A, a)(B, b)r_{xB, b}^{-1}r_{xB, y}r_{(xB)y}.
 \end{aligned}$$

□

**Theorem 3.6.** *For the Bol loop  $(Q, \circ)$  the map*

$$\varphi: \{(A, a), x\} \mapsto (A, a)r_x$$

*gives an isomorphism of Mikheev's groupoid  $(\text{PsAut}(Q, \circ) \times Q, \star)$  and the autotopism group  $\text{Atop}(Q, \circ)$ . In particular  $(\text{PsAut}(Q, \circ) \times Q, \star)$  is a group.*

PROOF: By Proposition 3.3 the map  $\varphi$  is a bijection of  $\text{PsAut}(Q, \circ) \times Q$  and  $\text{Atop}(Q, \circ)$ . By Lemma 3.2 and Corollary 3.5

$$\varphi(\{(A, a), x\} \star \{(B, b), y\}) = \varphi(\{(A, a), x\}) \varphi(\{(B, b), y\}).$$

Thus  $(\text{PsAut}(Q, \circ) \times Q, \star)$  and  $\text{Atop}(Q, \circ)$  are isomorphic as groupoids. Furthermore since  $\text{Atop}(Q, \circ)$  is itself a group, so is  $(\text{PsAut}(Q, \circ) \times Q, \star)$ . □

Theorem 1.2 is an immediate consequence.
