# A Carleson inequality for BMOA functions with their derivatives on the unit ball

#### HASI WULAN

Abstract. The main purpose of this note is to give a new characterization of the well-known Carleson measure in terms of the integral for BMOA functions with their derivatives on the unit ball.

Keywords: Carleson measure, BMOA functions, Hardy spaces Classification: 32A10, 32A35

#### 1. Introduction

Let B denote the unit ball in  $\mathbb{C}^n (n \ge 1)$ , and v the 2n-dimensional Lebesgue measure on B normalized so that v(B) = 1, while  $\sigma$  is the normalized surface measure on the boundary S of B.

For  $z = (z_1, \ldots, z_n)$  and  $w = (w_1, \ldots, w_n)$  in  $\mathbb{C}^n$ , we let  $\langle z, w \rangle = z_1 \overline{w}_1 + \cdots + z_n \overline{w}_n$  so that  $|z|^2 = \langle z, z \rangle$ . For  $\alpha = (\alpha_1, \ldots, \alpha_n)$  with each  $\alpha_i$  a nonnegative integer, we write  $|\alpha| = \alpha_1 + \cdots + \alpha_n, z^{\alpha} = z_1^{\alpha_1} \cdots z_n^{\alpha_n}, \overline{w^{\alpha}} = \overline{w}_1^{\alpha_1} \cdots \overline{w}_n^{\alpha_n}$ , and

$$\frac{\partial^{|\alpha|} f(z)}{\partial z^{\alpha}} = \frac{\partial^{|\alpha|} f(z)}{\partial z_1^{\alpha_1} \cdots \partial z_n^{\alpha_n}} \,,$$

where  $\partial^0 f(z) / \partial z^0 = f(z)$ .

For  $a \in B$ ,  $a \neq 0$ , let  $\varphi_a$  denote the automorphism of B taking 0 to a defined by

$$\varphi_a(z) = \frac{a - P_a(z) - \sqrt{(1 - |z|^2)Q_a(z)}}{1 - \langle z, a \rangle},$$

where  $P_a$  is the projection of  $\mathbb{C}^n$  onto the one-dimensional subspace span of aand  $Q_a$  is  $I - P_a$ . If a = 0, let  $\varphi_0(z) = z$ . For 0 < r < 1 and  $a \in B$ , let  $E(a,r) = \{z \in B : |\varphi_a(z)| < r\}$  as a pseudohyperbolic ball on B. It is easy to see that  $E(a,r) = \varphi_a(rB)$  and  $v(E(a,r)) \sim (1-|a|)^{n+1}$  (see [Ru, 2.2.7]), where the symbol "~" indicates that the quantities have ratios bounded and bounded away from zero as a varies.

The Hardy space  $H^p(0 is defined as the space of holomorphic functions <math>f$  on B satisfying

(1.1) 
$$\|f\|_p = \sup_{0 < r < 1} \left\{ \int_S |f(r\xi)|^p \, d\sigma(\xi) \right\}^{1/p} < \infty \, .$$

H. Wulan

The space BMOA consists of the functions  $f \in H^1$  for which

$$\|f\|_{BMOA} = \sup \frac{1}{\sigma(Q)} \int_Q |f - f_Q| \, d\sigma < \infty,$$

where  $f_Q$  denotes the averages of f over Q and the supremum is taken over all  $Q = Q_{\delta}(\xi) = \{\eta \in S : |1 - \langle \eta, \xi \rangle| < \delta\}$  for  $\xi \in S$  and  $0 < \delta \leq 2$ . Here we have identified f with its boundary function.

In the work on interpolation by bounded analytic functions on the unit disc  $\mathcal{D}$  of  $\mathbb{C}$ , L. Carleson [Ca1], [Ca2] found the following well-known result:

Let  $\mu$  be a positive measure on  $\mathcal{D}$  and 0 . Then an estimate of the form

(1.2) 
$$\left(\int_{\mathcal{D}} |f(z)|^p \, d\mu(z)\right)^{1/p} \le C_p \|f\|_p$$

holds for all  $f \in H^p$  if and only if there exists a constant C' > 0 such that

 $\mu(S(I)) \le C'|I|$ 

for all  $S(I) = \{z \in \mathcal{D} : z/|z| \in I, 1 - |I| \leq |z| < 1\}$ , where |I| denotes the arc length of the subarc I on the unit circle and  $S(I) = \mathcal{D}$  if  $|I| \geq 1$ . Here  $\mu$  is called a Carleson measure on  $\mathcal{D}$ .

We say that a positive measure  $\mu$  on B is a Carleson measure if there exists a constant C > 0 such that

$$\mu(B_{\delta}(\xi)) \le C\delta^n$$

for all  $\xi \in S$  and all  $\delta(0 < \delta \le 2)$ , where  $B_{\delta}(\xi) = \{z \in B : |1 - \langle z, \xi \rangle| < \delta\}$  is said to be a Carleson region. The definition above tells us that a Carleson measure is finite. Here and in the sequel, constants are denoted by C, they are positive and may differ from one occurrence to the other.

Hörmander [Hö] proved the higher dimensional version of Carleson's theorem above and gave a simple proof of Carleson's estimates. In this paper we shall give a new characterization of Carleson measures in terms of integrals for BMOAfunctions with their derivatives on the unit ball. Our main result is the following:

**Theorem 1.** Let  $\mu$  be a positive Borel measure on B,  $0 and <math>\alpha$  a multiindex. Then there exists a constant C > 0 such that

(1.3) 
$$\sup_{a \in B} \int_{B} \left| \frac{\partial^{|\alpha|} f(z)}{\partial z^{\alpha}} - \frac{\partial^{|\alpha|} f(a)}{\partial z^{\alpha}} \right|^{p} \frac{(1 - |a|^{2})^{n + \frac{3|\alpha|p}{2}} (1 - |z|^{2})^{\frac{|\alpha|p}{2}}}{|1 - \langle z, a \rangle|^{2n + 2|\alpha|p}} d\mu(z) \\ \leq C \|f\|_{BMOA}^{p}$$

for all  $f \in BMOA$  if and only if there exists a constant C' > 0 such that

(1.4) 
$$\mu(B_{\delta}(\xi)) \le C' \delta^{n+|\alpha|p}$$

for all  $\xi \in S$  and all  $\delta(0 < \delta \leq 2)$ .

### 2. Preliminary lemmas

**Lemma 1.** For 0 < r < 1 let a be a point in B with  $1 - |a| < 2\left(1 + \sqrt{\frac{2}{1-r}}\right)^{-2}$ . Then  $E(a,r) \subset B_{\delta}(\xi)$ , where  $\xi = a/|a|$  and  $\delta = (1 - |a|)\left(1 + \sqrt{\frac{2}{1-r}}\right)^2$ . PROOF: By the identity ([Ru])

$$1 - |\varphi_a(z)|^2 = \frac{(1 - |a|^2)(1 - |z|^2)}{|1 - \langle z, a \rangle|^2}$$

for  $a \in B$  and  $z \in E(a, r)$  we have (see [Je])

(2.1) 
$$\frac{1-r}{1+r} \le \frac{1-|a|^2}{1-|z|^2} \le \frac{1+r}{1-r},$$

and

(2.2) 
$$|1 - \langle z, a \rangle|^2 = \frac{(1 - |a|^2)(1 - |z|^2)}{1 - |\varphi_a(z)|^2} \le 4\left(\frac{1 - |a|}{1 - r}\right)^2.$$

Let  $\xi = a/|a|$ . We obtain

$$|1 - \langle z, \xi \rangle|^{\frac{1}{2}} \le |1 - \langle z, a \rangle|^{\frac{1}{2}} + |1 - \langle a, \xi \rangle|^{\frac{1}{2}} \le (1 - |a|)^{\frac{1}{2}} \left(1 + \sqrt{\frac{2}{1 - r}}\right).$$

Taking  $\delta = (1 - |a|) \left( 1 + \sqrt{\frac{2}{1-r}} \right)^2$  we get that  $E(a, r) \subset B_{\delta}(\xi)$ .

**Lemma 2.** Let  $f \in BMOA$  and let  $|\alpha|$  be a positive integer. Then there exists constant C > 0 such that

(2.3) 
$$\left|\frac{\partial^{|\alpha|}f(a)}{\partial z^{\alpha}}\right| \le C ||f||_{BMOA} (1-|a|)^{-|\alpha|}$$

for all  $a \in B$ .

PROOF: It is known that  $BMOA \subset \mathcal{B}(B)$ , where  $\mathcal{B}(B)$  is the Bloch space of holomorphic functions f on B with  $||f||_B = \sup\{(1 - |z|^2)| \bigtriangledown f(z)| : z \in B\} < \infty$ , where  $\bigtriangledown f(z) = (\partial f/\partial z_1, \dots, \partial f/\partial z_n)$  is the analytic gradient of f. From Theorem A in [Zh], for  $f \in BMOA$  and positive integer  $|\alpha|$ , we have

$$\left|\frac{\partial^{|\alpha|}f(a)}{\partial z^{\alpha}}\right| \le C \|f\|_B (1-|a|)^{-|\alpha|} \le C \|f\|_{BMOA} (1-|a|)^{-|\alpha|}$$

for all  $a \in B$ . Here we used the estimate  $||f||_B \leq C ||f||_{BMOA}$ .

**Lemma 3** ([Wu]). Let  $\mu$  be a finite positive measure on B, 0 < r < 1 and  $\beta > 0$ . Then

(2.4) 
$$\sup_{a \in B} \int_B \left( \frac{1 - |a|^2}{|1 - \langle z, a \rangle|^2} \right)^{n + \beta} d\mu(z) < \infty$$

if and only if there exists a constant C > 0 such that

(2.5) 
$$\mu(E(a,r)) \le C(1-|a|)^{n+\beta}$$

is fulfilled for all  $a \in B$ .

## 3. Proof of Theorem 1

We first consider the case  $|\alpha| = 0$ . Suppose that (1.4) holds for all  $\xi \in S$  and all  $\delta(0 < \delta \le 2)$ , that is,  $\mu$  is a Carleson measure on B. For a holomorphic function f on B and  $0 , from [Ch] we have that <math>||f||_{BMOA} < \infty$  implies

(3.1) 
$$\sup_{a \in B} \left\{ \int_{S} |f(\xi) - f(a)|^{p} \frac{(1 - |a|^{2})^{n}}{|1 - \langle \xi, a \rangle|^{2n}} \, d\sigma(\xi) \right\}^{1/p} < \infty \, .$$

Thus for each  $a \in B$  and each  $f \in BMOA$  we have

$$F_a(z) = (f(z) - f(a)) \left(\frac{(1 - |a|^2)^n}{(1 - \langle z, a \rangle)^{2n}}\right)^{1/p} \in H^p, \ 0$$

By Hörmander's result we have

$$\int_{B} |F_{a}(z)|^{p} d\mu \leq C_{p} \int_{S} |F_{a}(\xi)|^{p} d\sigma(\xi),$$

it follows that

$$\sup_{a \in B} \left\{ \int_{B} |f(z) - f(a)|^{p} \frac{(1 - |a|^{2})^{n}}{|1 - \langle z, a \rangle|^{2n}} d\mu(z) \right\}^{1/p} \\ \leq C' \sup_{a \in B} \left\{ \int_{S} |f(\xi) - f(a)|^{p} \frac{(1 - |a|^{2})^{n}}{|1 - \langle \xi, a \rangle|^{2n}} d\sigma(\xi) \right\}^{1/p} \\ \leq C' \|f\|_{BMOA}.$$

To prove that (1.4) follows from (1.3) we only need to prove that (1.4) is valid for all  $\xi \in S$  and all  $\delta(0 < \delta \leq \frac{1}{4})$  since  $\mu$  is finite. For each  $\xi \in S$  and each  $\delta(0 < \delta \leq \frac{1}{4})$  we take  $a' = (1 - 2\delta)\xi \in B$ . For  $z \in B_{\delta}(\xi)$  we have

(3.2) 
$$2\delta \le |1 - \langle z, a' \rangle| \le (|1 - \langle z, \xi \rangle|^{\frac{1}{2}} + |1 - \langle \xi, a' \rangle|^{\frac{1}{2}})^{2} \\ \le \sqrt{5}\delta < 3\delta < 4\delta(1 - \delta) = 1 - |a'|^{2}.$$

For fixed  $a' \in B$  above we choose a function  $f(z) = (1 - \langle z, a' \rangle)^{-n} \in BMOA$ . From (3.2) we have

$$\begin{split} \sup_{a \in B} \int_{B} |f(z) - f(a)|^{p} \frac{(1 - |a|^{2})^{n}}{|1 - \langle z, a \rangle|^{2n}} d\mu(z) \\ &\geq \int_{B} |f(z) - f(a')|^{p} \frac{(1 - |a'|^{2})^{n}}{|1 - \langle z, a' \rangle|^{2n}} d\mu(z) \\ &\geq \int_{B_{\delta}(\xi)} \left( |1 - \langle z, a' \rangle|^{-n} - (1 - |a'|^{2})^{-n} \right)^{p} \frac{(1 - |a'|^{2})^{n}}{|1 - \langle z, a' \rangle|^{2n}} d\mu(z) \\ &\geq (\frac{1}{\sqrt{5}} - \frac{1}{3})^{np} \delta^{-np} \int_{B_{\delta}(\xi)} \frac{(1 - |a'|^{2})^{n}}{|1 - \langle z, a' \rangle|^{2n}} d\mu(z) \\ &\geq C \delta^{-np-n} \mu(B_{\delta}(\xi)). \end{split}$$

(3.

(3.4) 
$$||f||_{BMOA}^p \le C(1-|a'|)^{-np} \le C\delta^{-np}.$$

Therefore, from (1.3), (3.3) and (3.4) there exists a constant C' = C(n, p) such that ,

$$\mu(B_{\delta}(\xi)) \le C'\delta^n,$$

this shows that  $\mu$  is a Carleson measure on B since  $\mu$  is finite.

Now we consider the case  $|\alpha| > 0$ . Assume that  $\mu$  satisfies (1.4) and let  $f \in$ BMOA. By Lemma 2 and the elementary inequality

$$(a+b)^p \le 2^p (a^p + b^p), \quad 0 0, \ b > 0,$$

we have

(

$$3.5) \qquad \int_{B} \left| \frac{\partial^{|\alpha|} f(z)}{\partial z^{\alpha}} - \frac{\partial^{|\alpha|} f(a)}{\partial z^{\alpha}} \right|^{p} \frac{(1 - |a|^{2})^{n + \frac{3|\alpha|p}{2}} (1 - |z|^{2})^{\frac{|\alpha|p}{2}}}{|1 - \langle z, a \rangle|^{2n + 2|\alpha|p}} d\mu(z) \\ \leq C \|f\|_{BMOA}^{p} \int_{B} \frac{(1 - |a|^{2})^{n + \frac{3|\alpha|p}{2}} (1 - |z|^{2})^{-\frac{|\alpha|p}{2}}}{|1 - \langle z, a \rangle|^{2n + 2|\alpha|p}} d\mu(z) + \\ + C \|f\|_{BMOA}^{p} \int_{B} \frac{(1 - |a|^{2})^{n + \frac{|\alpha|p}{2}} (1 - |z|^{2})^{\frac{|\alpha|p}{2}}}{|1 - \langle z, a \rangle|^{2n + 2|\alpha|p}} d\mu(z) \\ \leq C \|f\|_{BMOA}^{p} \int_{B} \left(\frac{1 - |a|^{2}}{|1 - \langle z, a \rangle|^{2}}\right)^{n + \frac{|\alpha|p}{2}} d\nu(z),$$

#### H. Wulan

where  $d\nu(z) = (1 - |z|^2)^{-\frac{|\alpha|p}{2}} d\mu(z)$ . For a fixed r(0 < r < 1) and  $a \in B$  with  $1 - |a| < 2\left(1 + \sqrt{\frac{2}{1-r}}\right)^{-2}$ , we set  $\xi = a/|a|$  and  $\delta = (1 - |a|)\left(1 + \sqrt{\frac{2}{1-r}}\right)^2$ . By (1.4), (2.1) and Lemma 1 we have

(3.6) 
$$\nu(E(a,r)) = \int_{E(a,r)} (1-|z|^2)^{-\frac{|\alpha|p}{2}} d\mu(z) \le C(1-|a|)^{n+\frac{|\alpha|p}{2}}$$

Since  $\mu$  is finite, we see that (3.6) holds for all  $a \in B$ . Using Lemma 3 for the case  $|\alpha| > 0$  and 0 we obtain

(3.7) 
$$\sup_{a\in B} \int_B \left(\frac{1-|a|^2}{|1-\langle z,a\rangle|^2}\right)^{n+\frac{|\alpha|p}{2}} d\nu(z) < \infty$$

Therefore, from the estimates (3.5) and (3.7) we get (1.3).

Conversely, suppose that (1.3) holds for all  $f \in BMOA$ . Let  $a \in B$  with |a| > 191/192 and take a' = (32|a| - 31)a/|a|, then  $Q_a(a') = 0$  and  $|\varphi_a(a')| > 176/197$ . Given r, 0 < r < 1/33, then  $a' \notin E(a, r)$ . By Lemma 1 and (2.2) for  $z \in E(a, r)$  we have

(3.8) 
$$|1 - \langle z, a' \rangle| \le (|1 - \langle z, a \rangle|^{\frac{1}{2}} + |1 - \langle a, a' \rangle|^{\frac{1}{2}})^2 \le \frac{825}{16}(1 - |a|),$$

and

(3.9) 
$$\frac{176}{3}(1-|a|) \le 1-|a'|^2 \le 64(1-|a|).$$

Combining (3.8) with (3.9) we have

(3.10) 
$$|1 - \langle z, a' \rangle| \le \left(\frac{15}{16}\right)^2 (1 - |a'|^2), \quad z \in E(a, r).$$

For fixed a' above we take  $f(z) = (1 - \langle z, a' \rangle)^{-n}$ . It is easy to see that  $f \in BMOA$  and for any positive integer  $|\alpha|$  we have

(3.11) 
$$\frac{\partial^{|\alpha|} f(z)}{\partial z^{\alpha}} = n(n+1)\cdots(n+|\alpha|-1)\overline{a'}^{|\alpha|}(1-\langle z,a'\rangle)^{-n-|\alpha|}.$$

From (2.1), (3.9), (3.10) and (3.11) we get

$$\begin{split} \sup_{a \in B} \int_{B} \left| \frac{\partial^{|\alpha|} f(z)}{\partial z^{\alpha}} - \frac{\partial^{|\alpha|} f(a)}{\partial z^{\alpha}} \right|^{p} \frac{(1 - |a|^{2})^{n + \frac{3|\alpha|p}{2}} (1 - |z|^{2})^{\frac{|\alpha|p}{2}}}{|1 - \langle z, a \rangle|^{2n + 2|\alpha|p}} d\mu(z) \\ &\geq \int_{B} \left| \frac{\partial^{|\alpha|} f(z)}{\partial z^{\alpha}} - \frac{\partial^{|\alpha|} f(a')}{\partial z^{\alpha}} \right|^{p} \frac{(1 - |a'|^{2})^{n + \frac{3|\alpha|p}{2}} (1 - |z|^{2})^{\frac{|\alpha|p}{2}}}{|1 - \langle z, a' \rangle|^{2n + 2|\alpha|p}} d\mu(z) \\ &\geq C(n, |\alpha|, p) \int_{E(a, r)} \left( |1 - \langle z, a' \rangle|^{-n - |\alpha|} - (1 - |a'|^{2})^{-n - |\alpha|} \right)^{p} \times \\ &\times \frac{(1 - |a'|^{2})^{n + \frac{3|\alpha|p}{2}} (1 - |z|^{2})^{\frac{|\alpha|p}{2}}}{|1 - \langle z, a' \rangle|^{2n + 2|\alpha|p}} d\mu(z) \\ &\geq C(1 - |a'|^{2})^{-np - |\alpha|p} \int_{E(a, r)} \frac{(1 - |a'|^{2})^{n + \frac{3|\alpha|p}{2}} (1 - |z|^{2})^{\frac{|\alpha|p}{2}}}{|1 - \langle z, a' \rangle|^{2n + 2|\alpha|p}} d\mu(z) \\ &\geq C(1 - |a|)^{-n - np - |\alpha|p} \int_{E(a, r)} \frac{(1 - |a'|^{2})^{n + \frac{3|\alpha|p}{2}} (1 - |z|^{2})^{\frac{|\alpha|p}{2}}}{|1 - \langle z, a' \rangle|^{2n + 2|\alpha|p}} d\mu(z) \\ &\geq C(1 - |a|)^{-n - np - |\alpha|p} \mu(E(a, r)). \end{split}$$

Also, we have

(3.13) 
$$||f||_{BMOA}^p \leq C(1-|a|)^{-np}.$$

Hence, from the estimates (3.12), (3.13) above and (1.3), we obtain

(3.14) 
$$\mu(E(a,r)) \le C'(1-|a|)^{n+|\alpha|p}$$

for  $\frac{191}{192} < |a| < 1$ . In fact, we can get that (3.14) is fulfilled for all  $a \in B$  since  $\mu$  is finite. Since  $|\alpha| > 0$  and 0 , then by Lemma 3 we know that (3.14) implies

(3.15) 
$$K = \sup_{a \in B} \int_B \left( \frac{1 - |a|^2}{|1 - \langle z, a \rangle|^2} \right)^{n + |\alpha|p} d\mu(z) < \infty.$$

For each  $\xi \in S$  and each  $\delta(0 < \delta \leq 2)$ , we set  $a = (1 - \frac{\delta}{2})\xi$ . For  $z \in B_{\delta}(\xi)$ , we have

$$|1 - \langle z, a \rangle| \le (|1 - \langle z, \xi \rangle|^{\frac{1}{2}} + |1 - \langle \xi, a \rangle|^{\frac{1}{2}})^2 \le 4\delta.$$

This implies that

(3.16)  

$$K \ge \int_{B} \left( \frac{1 - |a|^2}{|1 - \langle z, a \rangle|^2} \right)^{n + |\alpha|p} d\mu(z)$$

$$\ge \int_{B_{\delta}(\xi)} \left( \frac{1 - |a|^2}{|1 - \langle z, a \rangle|^2} \right)^{n + |\alpha|p} d\mu(z)$$

$$\ge C(p, n, |\alpha|) \delta^{-n - |\alpha|p} \mu(B_{\delta}(\xi)).$$

Therefore, from (3.15) and (3.16), we have

$$\mu(B_{\delta}(\xi)) < C\delta^{n+|\alpha|p}$$

for all  $\xi \in S$  and all  $0 < \delta \leq 2$ . Thus the proof of Theorem 1 is complete.  $\Box$ 

From the second part of the proof of Theorem 1, we can get the following result:

**Theorem 2.** Let  $\mu$  be a finite positive measure on B, 0 < r < 1 and  $\alpha > n$ . Then the following statements are equivalent:

- (i)  $\mu(B_{\delta}(\xi)) \leq C\delta^{\alpha}$  for all  $\xi \in S$  and all  $0 < \delta \leq 2$ ;
- (ii)  $\mu(E(a,r)) \leq C(1-|a|)^{\alpha}$  for all  $a \in B$ .

Notice that (i) implies (ii), but the converse fails if  $\alpha = n$  (see [Lu] for case n = 1), that is, the Carleson region  $B_{\delta}(\xi)$  cannot be replaced by the pseudohyperbolic ball E(a, r) for case  $n = \alpha$ .

Acknowledgment. The author wishes to thank the referee for valuable suggestions.
